

CloudXeus Incident Response Playbook

Operational Playbook for Managed Cloud Customers - June 2026

Incident Response Objective

The objective of incident response is to restore service safely, communicate clearly, and preserve enough evidence to understand root cause. Speed matters, but emergency changes must still follow approval and logging requirements.

Incident Lifecycle

Stage	Purpose	Typical actions
Detect	Identify a potential service issue.	Alert review, customer report validation, log inspection.
Triage	Classify severity and business impact.	Confirm affected users, workload, region, and workaround availability.
Mitigate	Reduce impact or restore minimum service.	Rollback, scale-out, failover, disable faulty integration, apply approved hotfix.
Resolve	Confirm normal service and close the active incident.	Validation tests, customer confirmation, monitoring review.
Review	Learn and prevent recurrence.	Root cause analysis, action items, runbook updates.

Communication Rules

- Severity 1 incidents require an initial customer update within 30 minutes of confirmation.
- Updates continue every 60 minutes until mitigation is confirmed, unless the customer requests a different cadence.
- The service delivery manager owns customer communication while engineers focus on diagnosis and mitigation.
- Post-incident reviews should be shared within five business days for Severity 1 incidents.

Emergency Change Control

Emergency production changes require approval from an authorized customer contact. The change record must include the reason, scope, expected impact, rollback plan, implementation time, and validation steps.
