

CloudXeus Product Overview

Version 2.4 - Updated May 2026

Company Overview

CloudXeus Technology Services provides managed cloud, application modernization, AI enablement, and platform operations services for mid-sized and enterprise customers. The company focuses on Azure-native architectures, secure integration patterns, and measurable business outcomes.

This overview describes the main CloudXeus service families used by sales, support, and customer success teams. It is intended as a demonstration document for retrieval-augmented generation and Azure AI Search labs.

Core Service Families

Service family	Description	Typical customer need
CloudXeus Managed Cloud	Day-to-day management of Azure environments, including monitoring, cost reviews, backups, and operational governance.	Customers need predictable operations without hiring a full internal cloud operations team.
CloudXeus App Modernization	Assessment and modernization of legacy web apps, APIs, databases, and integration workloads.	Customers want to move from virtual machines or legacy hosting to cloud-native platforms.
CloudXeus AI Enablement	Design and implementation of AI assistants, RAG solutions, document intelligence workflows, and agent-based prototypes.	Customers want to use generative AI with internal content and business processes.
CloudXeus Data Platform Services	Database modernization, reporting foundations, data ingestion, and governed analytics environments.	Customers need reliable data pipelines before building analytics or AI solutions.

AI Enablement Capabilities

CloudXeus AI Enablement projects usually begin with a discovery workshop. The team identifies business documents, support processes, risks, approval steps, and measurable outcomes. The most common first project is a document-grounded support assistant.

- RAG solutions using Azure AI Search for indexing and retrieval.
- Document processing workflows using OCR, layout extraction, and metadata enrichment.
- Agent prototypes that connect to approved tools such as knowledge bases, ticketing systems, and workflow APIs.
- Responsible AI reviews covering grounding, user consent, logging, data protection, and escalation paths.

Important Demo Facts

The CloudXeus AI Enablement team recommends hybrid search for most production RAG pilots because exact terms and semantic similarity are both useful in enterprise documents.

For customer-facing assistants, CloudXeus requires source citations in the response whenever the answer is based on internal policy or product documentation.
